Lithium-ion (Li-ion) EV battery prices have decreased dramatically over the past few years, mainly due to the fall in prices of critical battery metals: Lithium, cobalt and nickel. For example, the price of cobalt has fallen from roughly \$70,000 per metric ton in 2022 to about \$30,000 in 2024.

This study presents a comprehensive analysis of projected production costs for lithium-ion batteries by 2030, focusing on essential metals. It explores the complex interplay of factors, including economies of scale, R&D innovations, market dynamics, and metal price trends. The findings highlight.

Nickel demand is skyrocketing due to its use in lithium nickel manganese cobalt oxide (Li-NMC) batteries for EVs. Despite substantial investments in new mining operations, particularly in Southeast Asia, supply will need to grow further. Today, about 65% of class 1 nickel—a high-purity type.

This graphic illustrates the global battery market's growth by cathode type, comparing Nickel-Cobalt-Manganese (NCM) and Lithium Iron Phosphate (LFP) chemistries. This data comes exclusively from Benchmark Mineral Intelligence as of February 2025. Cathode: Electrode where lithium ions move during.

Nickel Manganese Cobalt (NMC) Battery Market By Battery Capacity (500 kWh, 500–1000 kWh, 1000–2000 kWh, >2000 kWh); By Application (Electric Vehicles, Grid Energy Storage, UPS Systems, Portable Devices); By End-Use Industry (Automotive, Energy Storage Systems, Consumer Electronics, Industrial).

The largest single contributor to the cost of battery cells is the materials used

in them, especially the cathode materials. In addition to lithium, the transition metals manganese, iron, cobalt and nickel are used in particular. At the beginning of the value chain is the mining of raw materials.
